Dry Edible Beans

Low Grower Prices and Large Stocks Drop Area

Because of extremely low prices, 2000 U.S. dry bean output is expected to decline from last year's level. USDA's *Prospective Plantings* report indicated that dry bean growers plan to seed 9 percent fewer acres this spring. The decline will likely be widespread among the various bean classes, including black, lima, blackeye, and Great Northern. Acreage devoted to pintos, the top bean class, is also likely to fall due to burdensome stocks and deteriorating prices.

Entering early spring, U.S. grower prices for all dry beans were 15 percent below the low levels experienced a year ago. This was the third consecutive annual decline, having dropped 10 percent in each of the past 2 years. Producers were coming off a year featuring the fourth largest planted area in the past 55 years and the lowest prices since 1992. Grower prices were almost universally low across every class of dry beans. This in itself is relatively unusual. Because most dry bean classes are actually separate markets with little apparent substitutability between them, supply, demand, and prices tend to vary independently. Thus, when pinto bean or dark red kidney bean prices are down, navy bean and light red kidney bean prices may be up. In most years, the independence of these markets has offsetting effects on industry-wide acreage changes. However, when weather is fairly even across all production areas as it was last year, all dry bean classes can experience similar yield patterns, changes in production, and ultimately, price movements. In the coming season, trend analysis (1970-99) suggests a 5-percent decline in U.S. dry bean yields to about 1,683 pounds per acre. Yields in 1999 exceeded trend by 6 percent.

In 2000, U.S. production of dry beans is expected to decline from last year's level of 33 million hundredweight (cwt). Current Economic Research Service (ERS) forecasts suggest total dry bean output could fall to a range of 28 to 30 million cwt. Reduced output is expected for most classes, especially black, Great Northern, navy, pinto, and blackeye, with the outlook for cranberry beans and large limas less certain. A combination of reduced output and somewhat stronger export demand (due to low prices) should help reduce dry bean stocks.

In Canada, low stocks prompted a 55-percent leap in production in 1999. Although this boosted stocks significantly and dropped average prices, the export market (especially in places like the United Kingdom [U.K.]) is expected to continue driving demand for Canadian dry beans. As a result, analysts expect Canadian growers to plant about 5 percent more acres this spring. However, assuming yields drop back to trend levels, production is expected to remain near the elevated year-earlier levels (about 6.5 million cwt), with average prices also dropping slightly as stocks creep upward.

U.S. dry bean export volume was disappointing to many in calendar year 1999, largely because the 26-percent reduction followed an exceptionally strong year in 1998. Actually, overall volume was about average, improving 3 percent from 1997 and 8 percent from 1996. In fact, the United States still maintains a solid, positive trade balance in dry edible beans. In 1999, export value totaled $207 million, while imports (excluding guar seeds) totaled $33 million. Guar seeds (also known as cluster beans) are largely used for industrial purposes, with 1999 imports totaling $17 million.

Over the past 5 years, an average of 19 percent of U.S. dry bean supplies have been exported. In 1999, about 8.2 million cwt, or 17 percent of available supply was exported. In 2000, ERS estimates suggest exports may total about 9 million cwt—about 20 percent of available supply. Over the past 5 calendar years, dealers of dark red kidney, navy, baby lima, and Great Northern beans have counted on exports to absorb a quarter or more of supplies. During this period, dealers of black and small red beans exported about a fifth of available supplies. Despite the fact that domestic markets have been much more important for most other dry bean classes, export markets also remain vital. For example, although pinto beans account for 40 percent of domestic dry bean consumption, over the past 5 years about 11 percent of pinto bean supplies were exported. Pintos totaled 20 percent of all U.S. dry bean export volume.

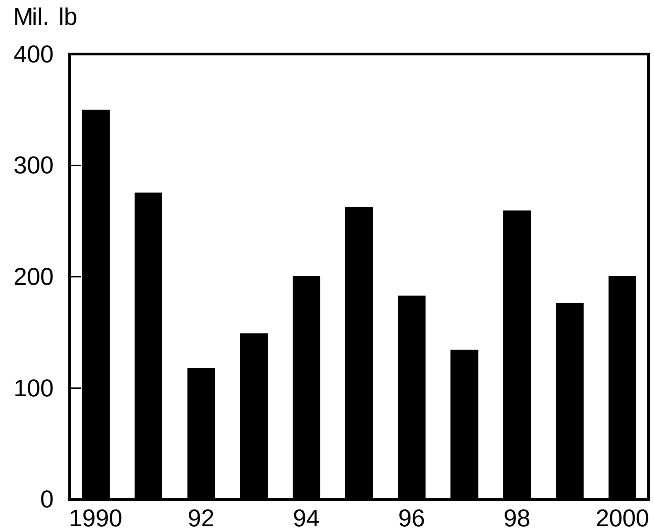
Pinto beans

Reflecting the general malaise in agriculture over the past year, the 1999/2000 pinto bean market remained weak. Despite a 25-percent reduction in production in 1999, weak export demand and persistently high stocks continue to weigh heavily on prices at both the grower and dealer levels. This spring, average grower prices in North Dakota and Colorado, the two leading pinto States, were the lowest since 1992. Market fundamentals for the 1999/2000 pinto bean season were as follows:

- Acres harvested in 1999 fell 30 percent to 644,900;
- Per-acre yields jumped 7 percent to 16.8 bags (cwt) per acre;
- Production totaled 10.8 million cwt, down 25 percent from 1998 but just 1 percent lower than the 1997 crop;
- Grower bids in North Dakota/Minnesota have averaged about $12.50 during the 1999/2000 marketing year—down 3 percent from a year earlier and 34 percent lower than in 1997/98;
- Dealer prices in Colorado have averaged $20.55, about 2 percent below a year earlier;
- The farm value of the 1999/2000 crop is down 28 percent to an estimated $136 million;
- Export volume during calendar year 1999 declined 32 percent to 176 million pounds. Exports were also 16 percent below the average of the 1990's;
- Import volume increased 25 percent to 21.4 million pounds—the fourth consecutive increase, with most volume coming from Canada;

Figure 27

Pinto beans: U.S. export volume



Source: Bureau of the Census, USDC.

With prices down, domestic use of pinto beans rose 6 percent to a record high 1.0 billion pounds—per capita use of pintos increased to 3.7 pounds. The record per capita use is 3.8 pounds set in 1992.

Entering early spring, grower prices for pinto beans in places such as North Dakota and Colorado were at or below the low levels experienced a year ago, likely prompting a modest cut in area. With acreage expected to decline and yields moving back down to trend, pinto production is likely to range from 9-10 million cwt. Production in this range would be a significant change since pinto bean production has not been less than 10 million cwt since 1993. With a small gain expected in export volume this year, pinto bean dealer prices, which averaged around $20.50 per cwt in 1999/2000, are currently expected to average a few dollars higher in 2000/01.

Navy beans

The 1999 navy (pea bean) crop was the fifth largest on record. With this crop, the navy bean market moved from a position of depleted stocks to one of oversupply in a single year. With stock positions higher, average grower prices for all bean classes in Michigan were the lowest since 1992. Navy bean market fundamentals during the 1999/2000 season include:

- Area harvested up 66 percent to 403,300 acres;
- Per-acre yields hit a record 18.1 bags (cwt), up 13 percent from a year earlier;
- Navy bean production rose 88 percent to 7.29 million cwt, just one year after harvesting the smallest crop of the decade;

- Grower prices for navy beans in Michigan have averaged about $14.05 during the 1999/2000 marketing year—down 27 percent from a year earlier but about the same as in 1997/98. Prices have been drifting lower during the season and stood at $11/cwt in March, the lowest grower price in a decade. In 1992, grower prices fell to similar levels following the record crop of 1991;
- Dealer prices in Michigan have averaged $21.30, about 19 percent below a year earlier;
- The farm value of the 1999/2000 navy crop jumped 48 percent to an estimated $107 million;
- Navy bean export volume in calendar 1999 increased 7 percent to 2.24 million cwt, with sales to the U.K. accounting for 54 percent. Import volume totaled 25,000 cwt, up 10,000 cwt;
- Jan. 1 stocks in Michigan were up 107 percent to 2.9 million cwt—about the same as 2 years ago.

Domestic use of navy beans likely rose 8 percent to 339 million pounds—however, this was 8 percent below average use during the 1990's. On a per-person basis, use of navy beans increased 7 percent to 1.24 pounds. The highest per capita use in the past 30 years was 2.4 pounds in 1973.

For the coming season, it appears likely that navy bean output will decline because of poor navy bean grower prices, comparatively attractive soybean and grain loan rates, and the expectation of lower yields. With the possibility of lower acreage, and yields moving back down to trend, navy bean production is likely to drop back to a range of 5 to 6 million bags. With current low prices encouraging a small increase in domestic and export volume, stocks should be reduced to more profitable levels this season. Reduced supplies and stronger domestic and export use should support sightly higher navy bean prices in 2000/01.

Table 39--Dry edible beans: U.S. planted acreage, 1992-96 average, 1997-2000
